1. Specify
engineer
Requirement editor ★
REAL-DSL
DSL parser
Requirement check ★
named modules exist
no assumption about the system
R0: checked requirement
goal model (KAOS)
2. Generate and execute tests
runs as a job on a GPU cluster (Slurm, Apptainer image)
run folder
traces · results
Safety monitor ★
+ telemetry recorder
Scenario execution
Scenic → CARLA
System under test
YOLOv5 detector + braking
scenarios
Scenario search
grammar → GE (GRAPE) or grid
3. Diagnose
Validity check ★
assumptions held / broken
valid vs spurious failures
Failure classifier ★
failure type per trace
Obstacle analyser ★
obstacles with evidence
assumption verdicts
diagnosis
valid failures · obstacles
assumption verdicts
4. Decide and refine
engineer
decisions.json
+ R1 with its changes
labelled [S] [D] [R]
Requirement writer ★
R1 with labelled changes
Review interface ★
five steps · mitigation menu
[D] [R]: re-diagnosed, no new simulation
[S]: next round, R1 is the new input
